

# Transport Layer: outline

3.1 transport-layer services

3.2 multiplexing and demultiplexing

3.3 connectionless transport: UDP

3.4 principles of reliable data transfer

3.5 connection-oriented transport: TCP

- segment structure
- reliable data transfer
- flow control
- connection management

3.6 principles of congestion control

3.7 TCP congestion control

# UDP: User Datagram Protocol [RFC 768]

- ❖ “no frills,” “bare bones”  
Internet transport protocol
- ❖ “best effort” service,  
UDP segments may be:
  - lost
  - delivered out-of-order to app
- ❖ *connectionless*:
  - no handshaking between UDP sender, receiver
  - each UDP segment handled independently of others
- ❖ UDP use:
  - streaming multimedia apps (loss tolerant, rate sensitive)
  - DNS
  - SNMP
- ❖ reliable transfer over UDP:
  - add reliability at application layer
  - application-specific error recovery!

# UDP: segment header

UDP segment format

## why is there a UDP?

- ❖ no connection establishment (which can add delay)
- ❖ simple: no connection state at sender, receiver
- ❖ small header size
- ❖ no congestion control: UDP can blast away as fast as desired

# UDP checksum

*Goal:* detect “errors” (e.g., flipped bits) in transmitted segment

## sender:

- ❖ treat segment contents, including header fields, as sequence of 16-bit integers
- ❖ checksum: addition (one's complement sum) of segment contents
- ❖ sender puts checksum value into UDP checksum field

## receiver:

- ❖ compute checksum of received segment
- ❖ check if computed checksum equals checksum field value:
  - NO - error detected
  - YES - no error detected.

# Internet checksum: example

example: add two 16-bit integers

	1	1	1	0	0	1	1	0	0	1	1	0	0	1	1	0
	1	1	0	1	0	1	0	1	0	1	0	1	0	1	0	1
<hr/>																
wraparound	1	1	0	1	1	1	0	1	1	1	0	1	1	1	0	1
<hr/>																
sum	1	0	1	1	1	0	1	1	1	0	1	1	1	1	0	0
checksum	0	1	0	0	0	1	0	0	0	1	0	0	0	0	1	1

*Note:* when adding numbers, a carryout from the most significant bit needs to be added to the result

3.6 principles of congestion control

3.7 TCP congestion control

# Principles of reliable data transfer

- ❖ important in application, transport, link layers
  - top-10 list of important networking topics!

(a) provided service

- ❖ characteristics of unreliable channel will determine complexity of reliable data transfer protocol (rdt)

# Principles of reliable data transfer

- ❖ important in application, transport, link layers
  - top-10 list of important networking topics!

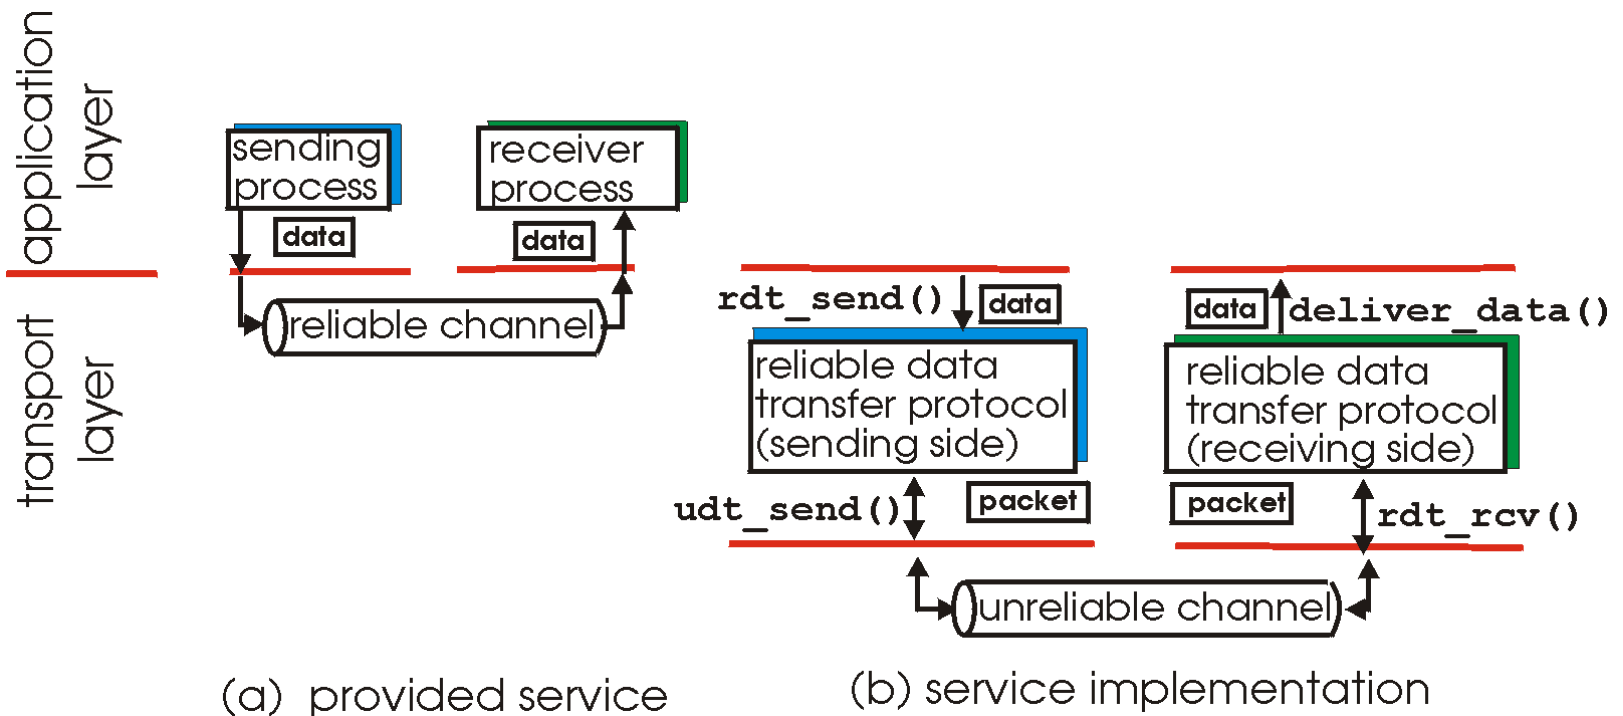

- ❖ characteristics of unreliable channel will determine complexity of reliable data transfer protocol (rdt)

# Principles of reliable data transfer

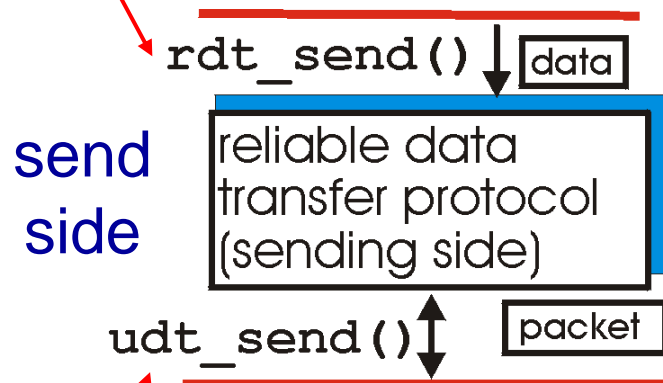

- ❖ important in application, transport, link layers
  - top-10 list of important networking topics!

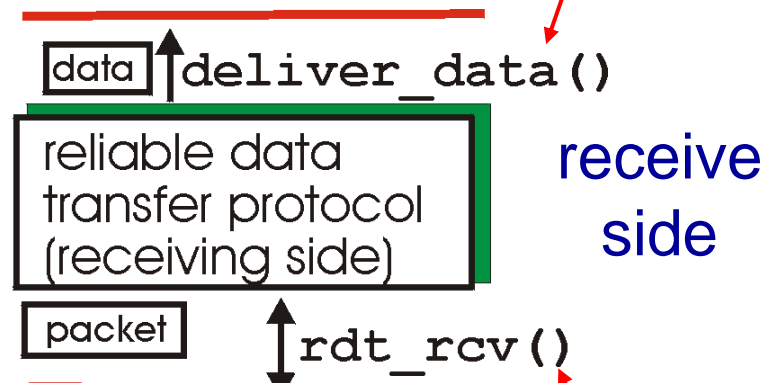

- ❖ characteristics of unreliable channel will determine complexity of reliable data transfer protocol (rdt)

# Reliable data transfer: getting started

**rdt\_send()** : called from above,  
(e.g., by app.). Passed data to  
deliver to receiver upper layer

**deliver\_data()** : called by  
**rdt** to deliver data to upper

**udt\_send()** : called by rdt,  
to transfer packet over  
unreliable channel to receiver

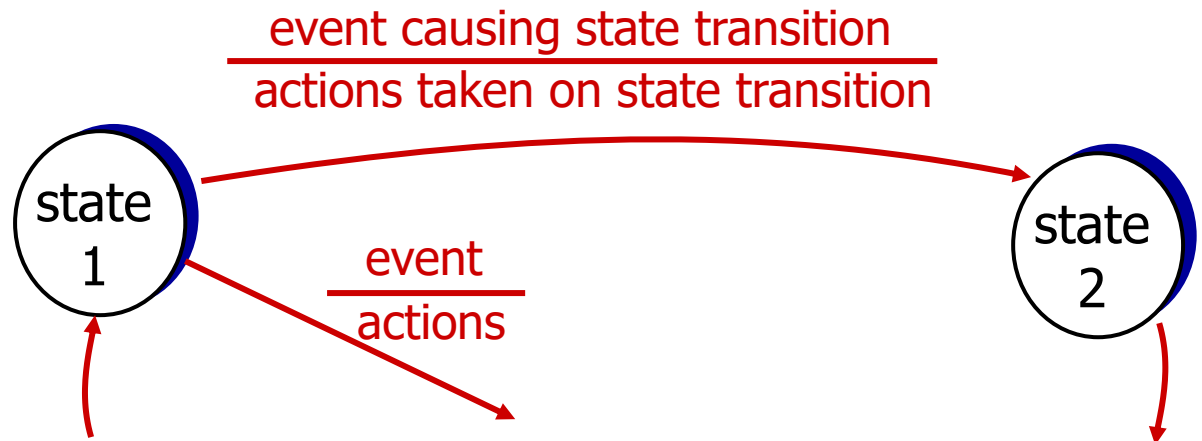

**rdt\_rcv()** : called when packet  
arrives on rcv-side of channel

# Reliable data transfer: getting started

we'll:

- ❖ incrementally develop sender, receiver sides of reliable data transfer protocol (rdt)
- ❖ consider only unidirectional data transfer
  - but control info will flow on both directions!
- ❖ use finite state machines (FSM) to specify sender, receiver

**state:** when in this “state” next state uniquely determined by next event

# rdt1.0: reliable transfer over a reliable channel

## ❖ underlying channel perfectly reliable

- no bit errors
- no loss of packets

## ❖ separate FSMs for sender, receiver:

- sender sends data into underlying channel
- receiver reads data from underlying channel

sender

receiver

# rdt2.0: channel with bit errors

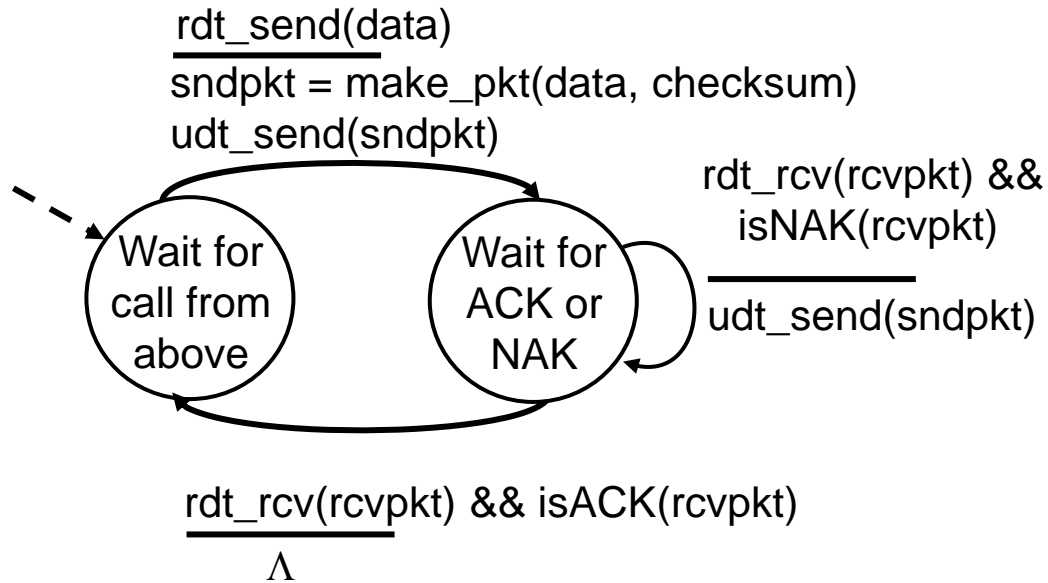

- ❖ underlying channel may flip bits in packet
  - checksum to detect bit errors
- ❖ *the question: how to recover from errors:*

*How do humans recover from “errors”  
during conversation?*

# rdt2.0: channel with bit errors

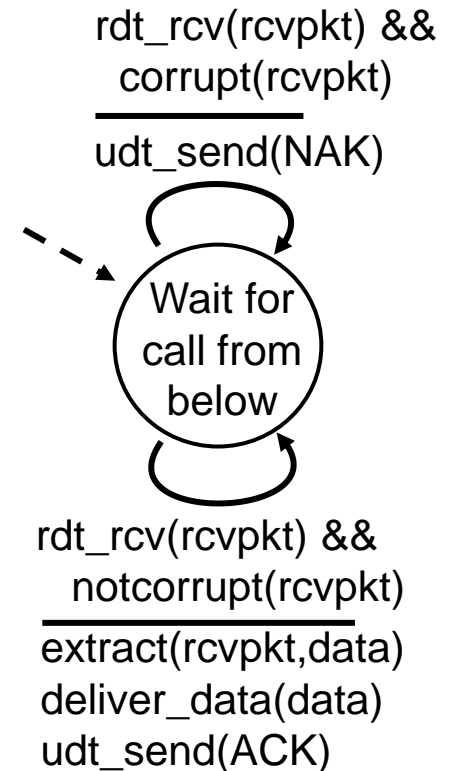

- ❖ underlying channel may flip bits in packet
  - checksum to detect bit errors
- ❖ *the question: how to recover from errors:*
  - *acknowledgements (ACKs)*: receiver explicitly tells sender that pkt received OK
  - *negative acknowledgements (NAKs)*: receiver explicitly tells sender that pkt had errors
  - sender retransmits pkt on receipt of NAK
- ❖ new mechanisms in `rdt2.0` (beyond `rdt1.0`):
  - error detection
  - feedback: control msgs (ACK,NAK) from receiver to sender

# rdt2.0: FSM specification

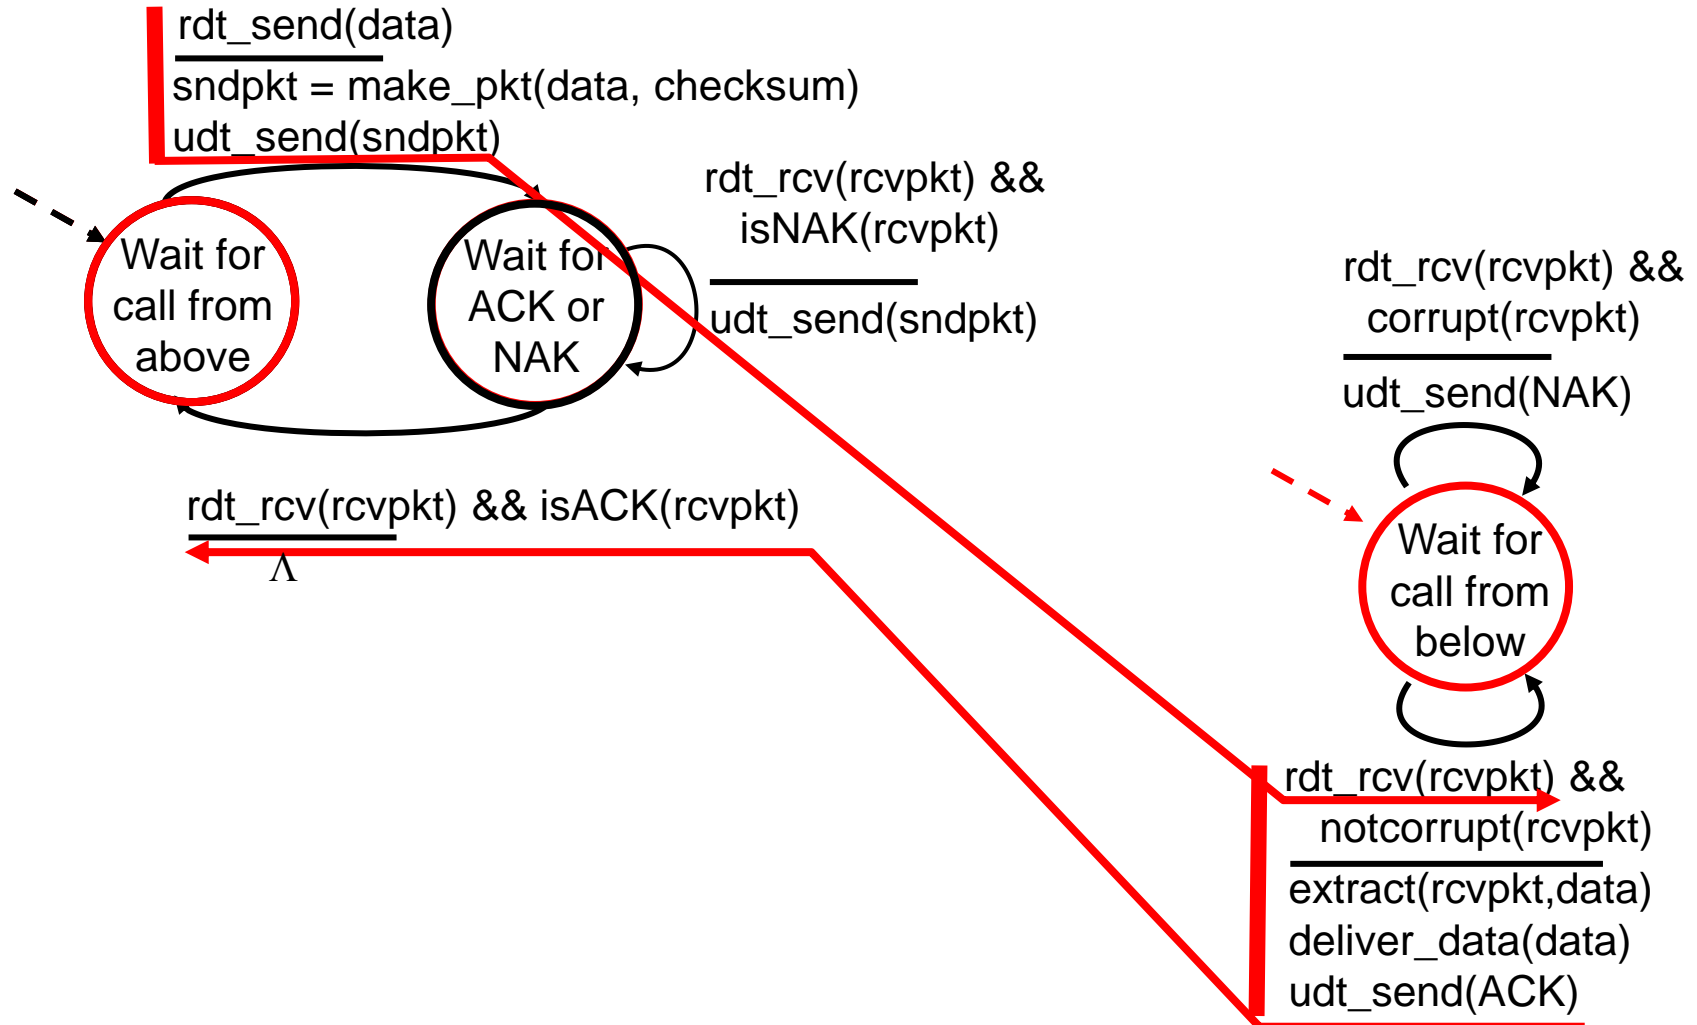

sender

receiver

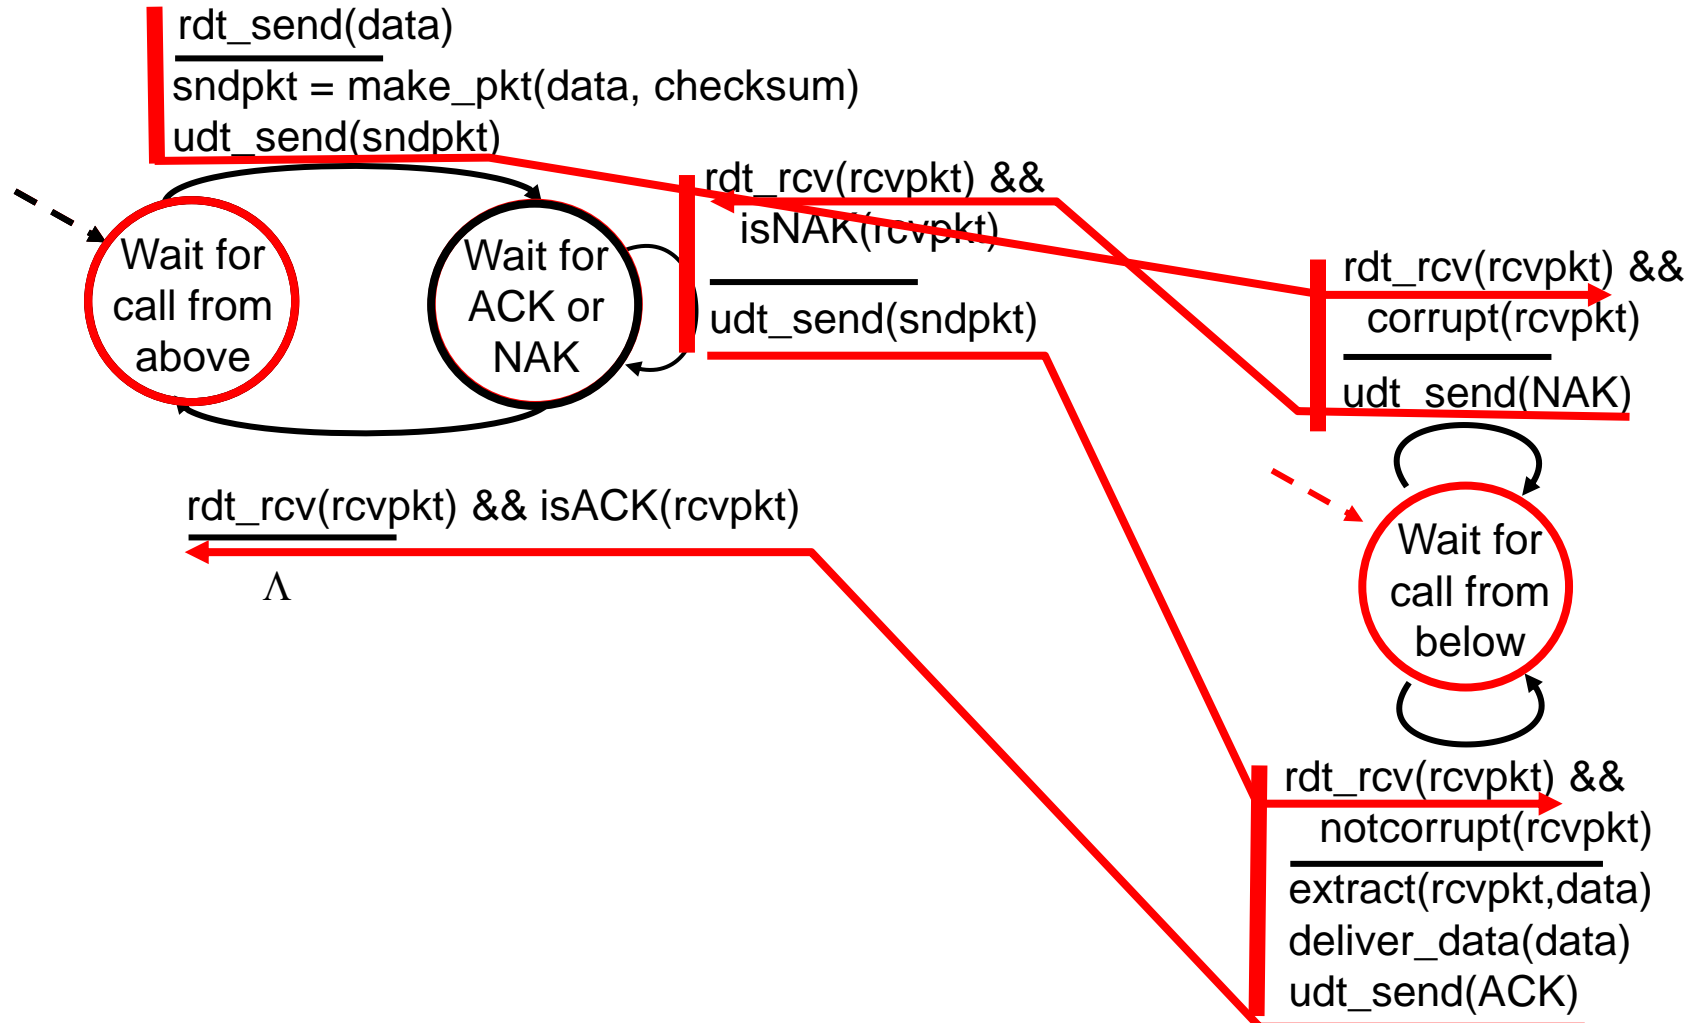

# rdt2.0: operation with no errors

# rdt2.0: error scenario

# rdt2.0 has a fatal flaw!

## what happens if ACK/NAK corrupted?

- ❖ sender doesn't know what happened at receiver!
- ❖ Can't just retransmit?
  - possible duplicate

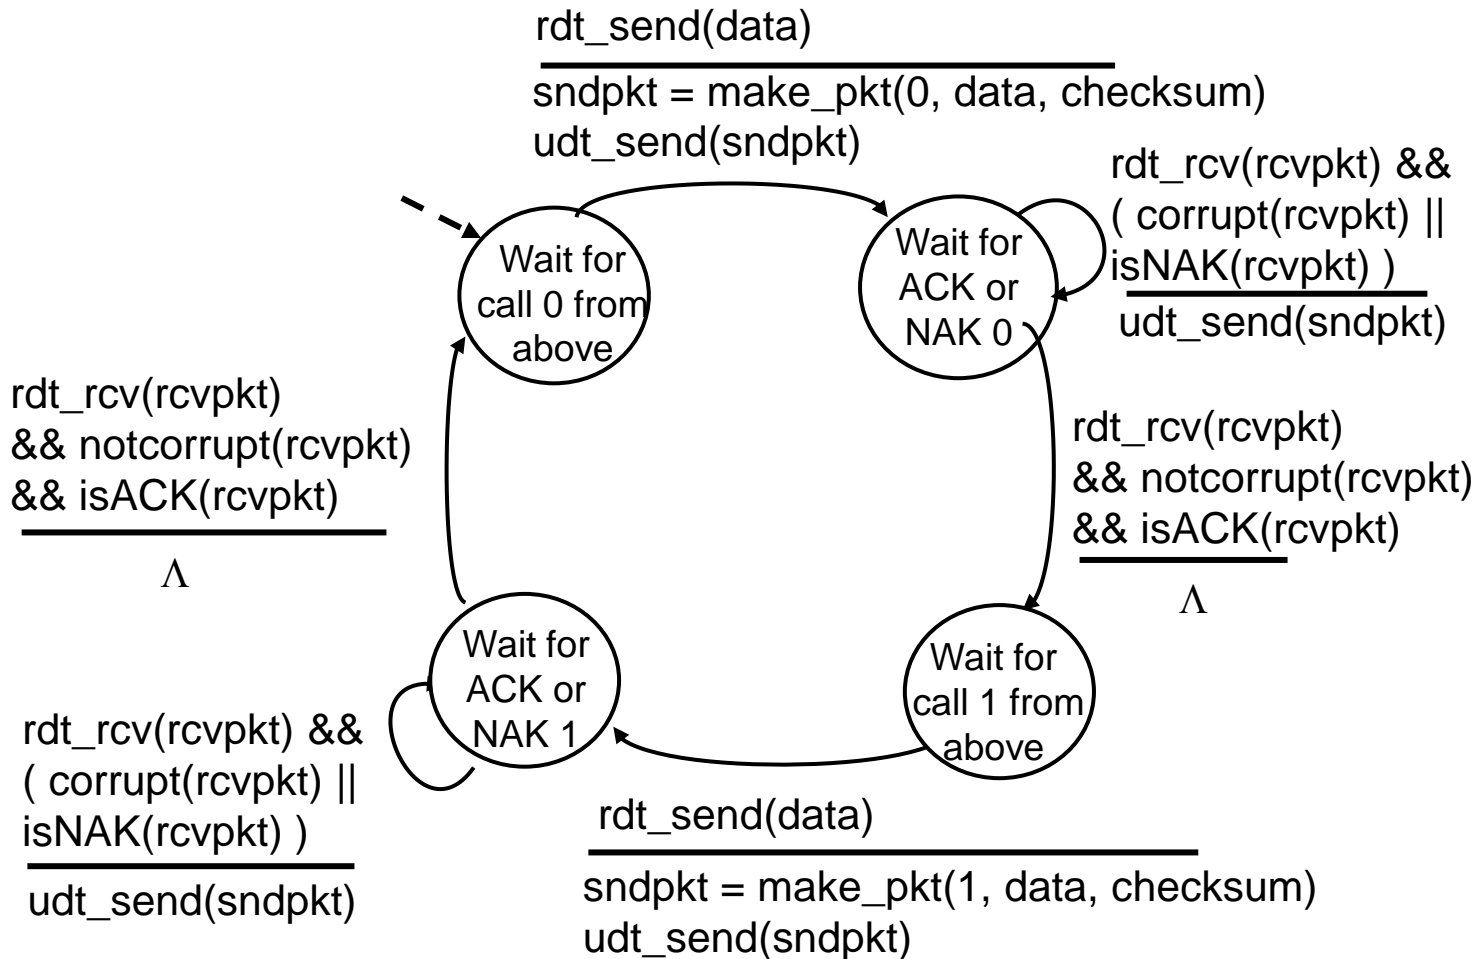

## How to handle duplicates?

- ❖ sender retransmits current pkt if ACK/NAK corrupted
- ❖ sender adds *sequence number* to each pkt
- ❖ receiver discards (doesn't deliver up) duplicate pkt

### stop and wait

sender sends one packet,  
then waits for receiver  
response

# rdt2.1: sender, handles garbled ACK/NAKs

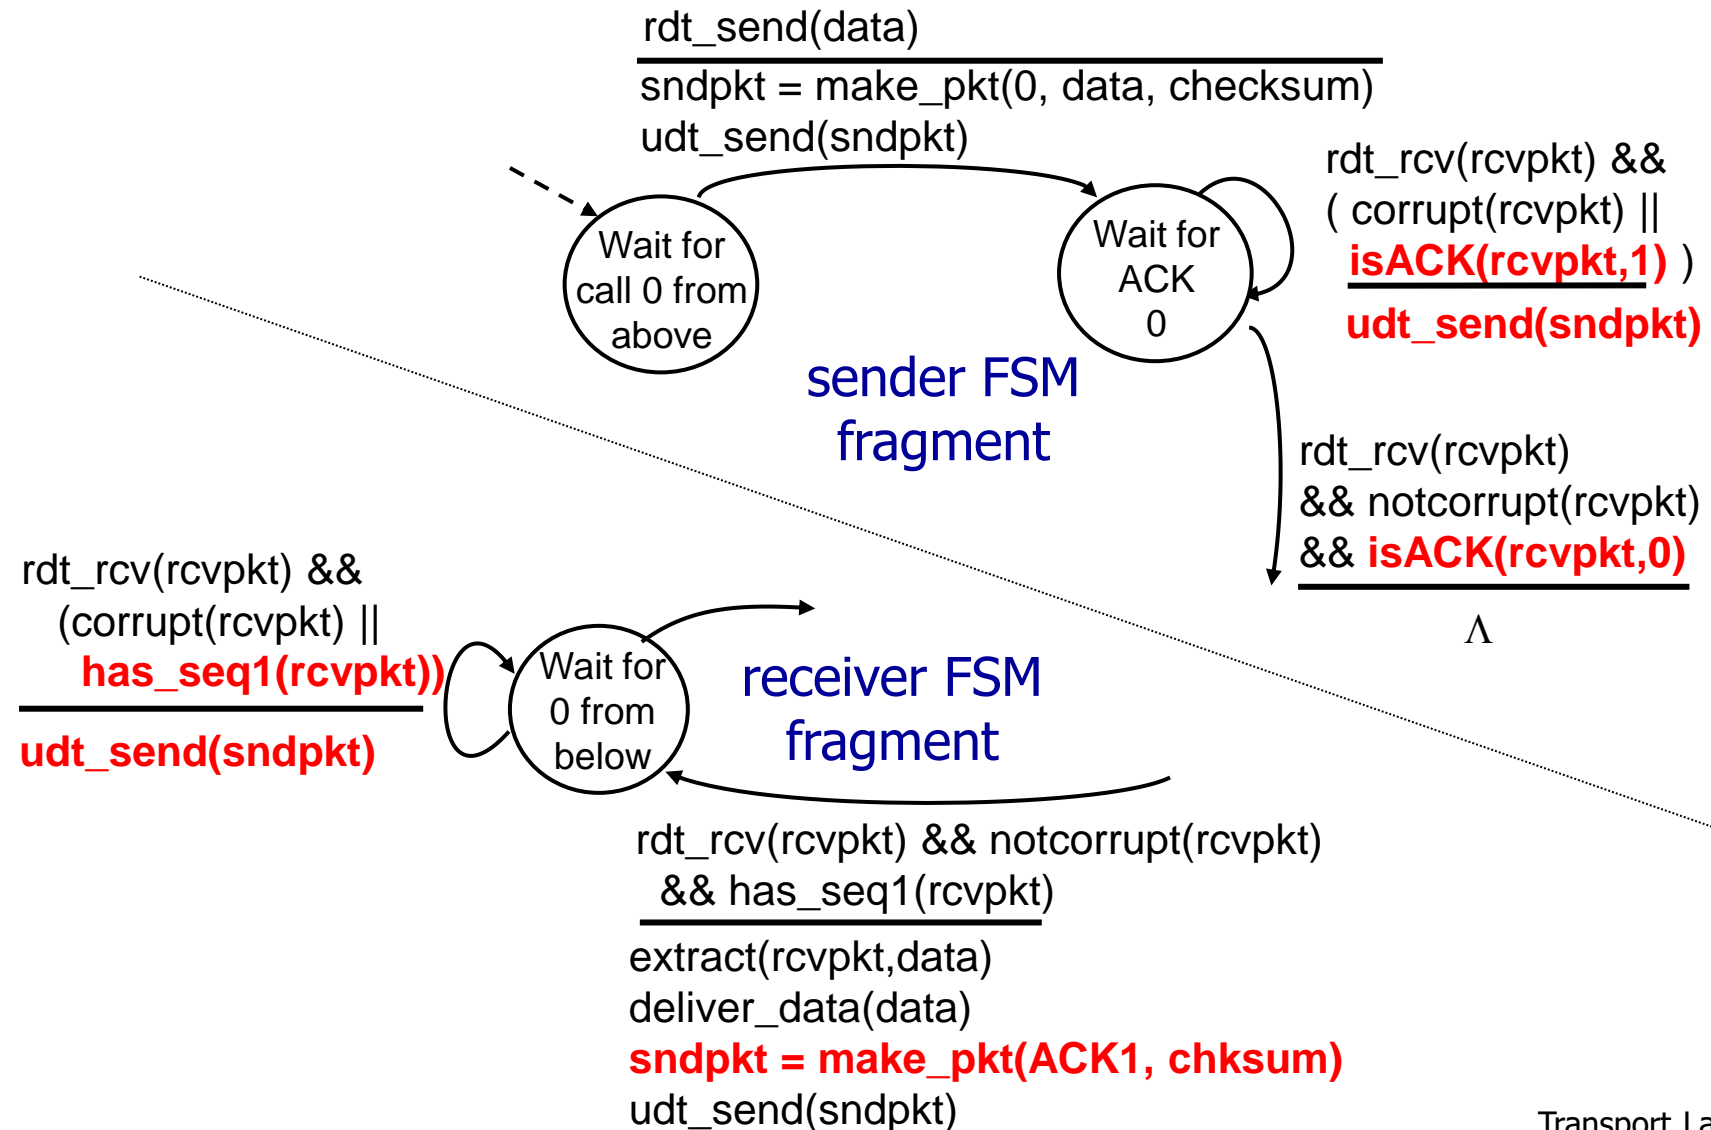

# rdt2.1: receiver, handles garbled ACK/NAKs

## rdt2.2: a NAK-free protocol

- ❖ same functionality as rdt2.1, using ACKs only
- ❖ instead of NAK, receiver sends ACK for last pkt received OK
  - receiver must *explicitly* include seq # of pkt being ACKed
- ❖ duplicate ACK at sender results in same action as NAK: *retransmit current pkt*

# rdt2.2: sender, receiver fragments

# rdt3.0: channels with errors and loss

## new assumption:

underlying channel can also lose packets (data, ACKs)

- checksum, seq. #, ACKs, retransmissions will be of help ... but not enough

approach: sender waits “reasonable” amount of time for ACK

- ❖ retransmits if no ACK received in this time
- ❖ if pkt (or ACK) just delayed (not lost):
  - retransmission will be duplicate, but seq. #'s already handles this
  - receiver must specify seq # of pkt being ACKed
- ❖ requires countdown timer
